

NORS MAPPING MATRIX v3.0126

RTITB Registered instructors with relevant registered truck qualifications can be automatically validated by the NORS database to deliver a course they may not have a NORS registration for.

For example - an instructor who is registered for Rough Terrain Telescopic and Counterbalance but not for Rough Terrain Masted – NORS will allow them to register training for the Masted, as they have the key skills from the two other machines to operate this.

We have listed the most popular mapping combinations below for your information. If you have any other combinations you'd like us to check, please contact qa@rtitb.com

Note:

Although an instructor may be route-mapped to an additional lift truck type based on justified correlation, this does **not** remove the requirement for specific and familiarisation training on that particular machine. This training is essential to ensure the instructor fully understands the machine's operational characteristics, control layout, and workplace application. It also supports safe, effective instruction and ensures compliance.
